Exercise Sheet 10
Version 02.07.2020

## Exercise 1.

Let $p:=3, q:=11$, as well as $n:=p q$ and consider the associated RSA algorithm with encryption coefficient $e:=17$. Noting that $0,1,32 \in \mathbb{Z}_{33}$ are fixed points of the associated RSA algorithm, we investigate the following plain text alphabet $\mathcal{A}:=$ $\left\{z_{i} \mid i \in\{2, \ldots, 31\}\right\}$ for encryption via the RSA:

| $i$ | $z_{i}$ | $i$ | $z_{i}$ |  | $i$ | $z_{i}$ |  | $i$ | $z_{i}$ | $i$ | $z_{i}$ | $i$ | $z_{i}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2 | A | 7 | F |  | 12 | K |  | 17 | P |  | 22 | U |  |
|  | 27 | Z |  |  |  |  |  |  |  |  |  |  |  |
| 3 | B | 8 | G |  | 13 | L |  | 18 | Q |  | 23 | V | 28 |
| 4 | C | 9 | H |  | 14 | M |  | 19 | R |  | 24 | W | 29 |
| 5 | D | 10 | I | 15 | N |  | 20 | S |  | 25 | X | 30 | $?$ |
| 6 | E | 11 | J |  | 16 | O |  | 21 | T |  | 26 | Y | 31 |

a) Encrypt the plaintext TAU CETI using the RSA algorithm.
b) Decrypt the cipher text YIZXG? which has been created using the above RSA algorithm.

## Exercise 2.

For distinct odd primes $p, q \in \mathbb{P}$, let $n:=p q$ be the associated RSA module. Show that one can easily find $p$ and $q$ only from the knowledge of $n$ and $\varphi(n)$ by solving a certain quadratic equation.
Hint: Observe that precisely $p$ and $q$ are the roots of the polynomial: $x \mapsto(x-p)(x-q)$. Rearrange the latter.

## Exercise 3.

Let $n=p \cdot q$ be the product of two different unknown prime numbers. Let $e, d$ be two integers such that $e \cdot d=1 \bmod \varphi(n)$.
a) Show that $x^{2} \equiv 1 \bmod n$ has exactly four solutions in $\mathbb{Z}_{n}$.
b) Why the $\operatorname{gcd}(x-1, n)$ is equal to $p$ or $q$, where $x$ is nontrivial solution of the equation in a)?
c) Show that $a^{k} \equiv 1 \bmod n$ for every $a \in \mathbb{Z}_{n}$, where $k:=e \cdot d-1$.
d) Why exist $r, t \in \mathbb{N}$ such that $k=2^{t} \cdot r$ with $r$ odd and $t \geq 1$ ?
e) Show that one element of the sequence $a^{\frac{k}{2^{i}}} \bmod n, i=1, \ldots, t$ is a solution of the equation in a).
f) How can you factor $n$ given encryption and decryption coefficient $e$ and $d$ ?
